

AGENT-READY COMMERCE

# Position your product to be found and bought by an AI agent.

A new buyer just showed up: the **AI agent** doing the research and, increasingly, the purchase. It doesn't skim your homepage or sit through a demo. It parses, compares, and acts. Here's how to be the product it picks.

## // THE SHIFT IN ONE LINE

For a decade we optimized for a human who already knew our name. The agent doesn't. It evaluates on **structured, unambiguous, machine-readable** signals — and it transacts on **clear units and predictable cost**. Being listed is the on-ramp; being *legible and transactable* is how you get bought.

### 1 Discoverable

The agent has to find you when it's solving a task. Claim requirement-shaped queries ("X for HIPAA", "X with SSO"), structure your categories, and make sure docs and pricing are crawlable — not locked behind a form or a video.

### 2 Machine-legible

Capabilities, limits, inputs/outputs, and integrations in literal, consistent terms — not one prose blob and not metaphors. If an agent can't summarize you correctly, it can't recommend you.

### 3 Transactable

Clear units, predictable cost, and terms an agent can accept without a human handshake — a private offer, standard contract, or metered path. "Contact us for pricing" is a dead end to a bot.

### 4 Data-as-a-product

If you sell data or AI, be explicit about licensing for training vs. inference-time retrieval vs. agentic tool-use. Each is a different unit of value an agent buys differently.

→ The agent-ready checklist

ordered by impact

Work top-down. The first three move the needle most.

1

**Machine-legible product statement.** What it is, the exact job it does, inputs and outputs — in unambiguous nouns.

☐

2

**Trigger tasks listed.** "When an agent is doing X, you are the right tool" — phrased the way an agent would query it.

☐

3

**Deterministic pricing.** Expressible as data — units, dimensions, and cost with no "contact us" on the base path.

☐

4

**Structured specs.** Integrations, constraints, and limits an agent can match to a requirement, line by line.

☐

5

**Programmatic purchase path.** A private offer / standard contract / metered route that starts without a human in the loop.

☐

6

**Crawlable proof.** Outcomes, security posture, and docs in text an agent can read — not trapped in images or gated PDFs.

☐

7

**Identity graph.** Consistent name, category, and links across your listing, site, and docs so an agent resolves "you" to one entity.

☐

→ Human-tuned vs. agent-ready

| HUMAN-TUNED (TODAY)                      | AGENT-READY (NEXT)                                                                                      |
|------------------------------------------|---------------------------------------------------------------------------------------------------------|
| "The leading platform for modern teams." | "Incident-response automation for AWS. Input: CloudWatch alerts. Output: triaged root cause + runbook." |
| Pricing behind "Contact sales."          | "\$X per host / month, metered, standard contract."                                                     |
| Proof in a customer-story video.         | "Cut MTTR 51% at [named customer]" — in text, on the page.                                              |
| Value in a clever tagline.               | Value in literal capabilities an agent can match to a need.                                             |

// THE TEST

Hand your listing to an LLM and ask: "what does this do, who's it for, and what does it cost?"

If the answer is vague, hedged, or wrong, that's exactly what the buyer's agent will conclude too. Clarity for the agent is clarity for the human — fixing one fixes both.

Get ahead of your category.

Agent-as-buyer is early — which is the whole opportunity. In a free 30-minute call I'll audit
