

THE PRICING STORY WORKSHEET

A pricing narrative that survives procurement.

For committed-spend deals and data/AI products bought by humans **and** agents. Work the five blocks top to bottom — you finish with a price you can defend and a story a buyer repeats.

01 Name your value metric

The thing that scales with the buyer's success — not the thing that's easy for you to count.

What does the buyer actually get?

the outcome, not the feature

What scales as they succeed?

seats · calls · GB · tokens · outcomes

Does your current price track it?

if not, that's the gap

02 Build the package ladder

Three tiers, each for a different buyer and a different moment.

TIER	WHO IT'S FOR	WHAT'S IN IT	PRICE / UNIT
Entry			
Standard			
Committed			

Test: can a buyer self-select their tier in one read? If two tiers feel the same, collapse them.

03 Write the pricing narrative

Fill the blanks. This is the paragraph that goes on the listing and into the deal.

We price on **[value metric]** because that's what grows as you get **[buyer outcome]**. A typical **[buyer type]** starts at **[entry]** and scales to **[committed]** as **[what grows]**. You can see the full cost before you talk to us, and the price tracks your usage — so it's defensible in a procurement review and predictable on your AWS bill.

04 Add the agent-buyer note

How an autonomous buyer would evaluate and transact this.

Units, as data

expressible without a sales call

Cost predictability

what a budget-bounded agent can model

Machine-readable terms

acceptable without a human handshake

05 Find the committed-spend unlock

Where a private offer or committed structure unlocks a bigger deal.

Which deals justify a private offer?

EDP / MACC fit

does it draw down committed AWS spend?

The trade you'll offer

term / volume for price or features

Pressure-test your price with me.

This worksheet is part of the SaaS Marketing Foundry toolkit. Bring your filled-in version to a working session and we'll stress-test the metric, the ladder, and the committed-spend structure against how buyers — and their agents — actually evaluate it.
